02/28/24 (Not in 3NF)
drillData

      Drill_Name (text)

            not nullable, "New Drill" as default value, must be unique

      Level (text)

            nullable

      Player_# (number)

            int4, nullable, 6 as default value

      Duration (number)

            Int2, nullable, 0 as default value

      Focus (text)

            nullable

      Description (text)

            Nullable

      Scoring (text)

            nullable

      Behaviors (text)

            nullable

      Variations (text)

            nullable

      Category (text)

            nullable

02/17/24

Work

- Created *Retool* logins
- Established Retool database format
- Connected Retool database with "First App"
  - Named SpikeDB
- Rework a copy of the Drill Matrix
  - Plan to "import from cvs" to populate the database
  - Category is from the sheet tabs
  - Removing range times into only the maximum times
- Retool has an embed capability which we can use for HTML and JavaScript
  - Means cannot be public, public
  - Solution: Can create a universal "client login" to act as an authenticator
    - Google account for admin + backup
    - Password is the same

Questions

- What can be blank in the database?
- What are the values of "scores?"

- For duration, we took maximum scores
  - Idea behind this is if team finishes early, can move on to another drill set

To Do

☐ Figure out how to back-up the database
☐ Figure out how to pipe database results to a working website
    ☐ View from phones
☐ Add, edit, and update data without needing the database manager
